

Preservation-controller recipe study (V17-V18)
Training-domain calibration only; dashed lines are frozen acceptance thresholds

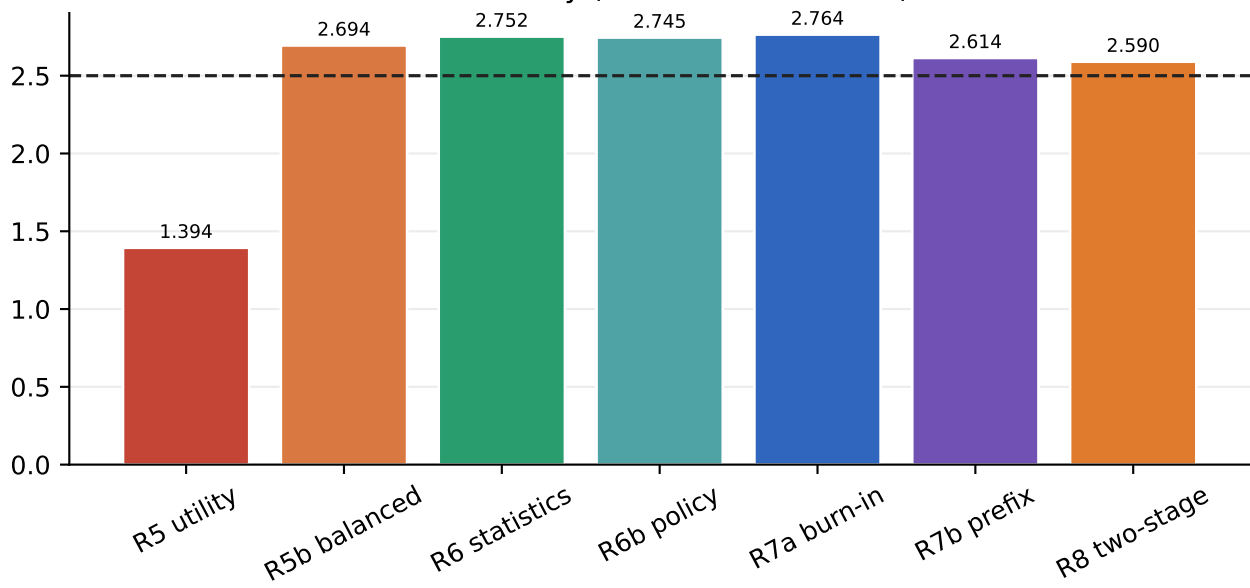

Avoidable violation rate (frozen maximum 0.2)

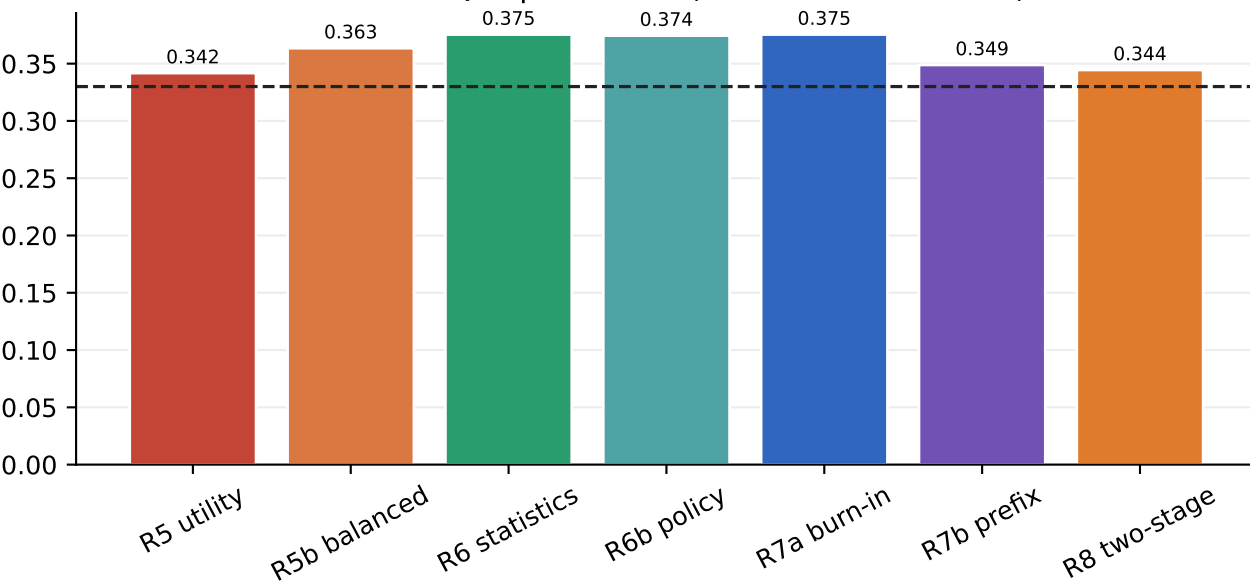

Mean constraint violation (frozen maximum 1.5)

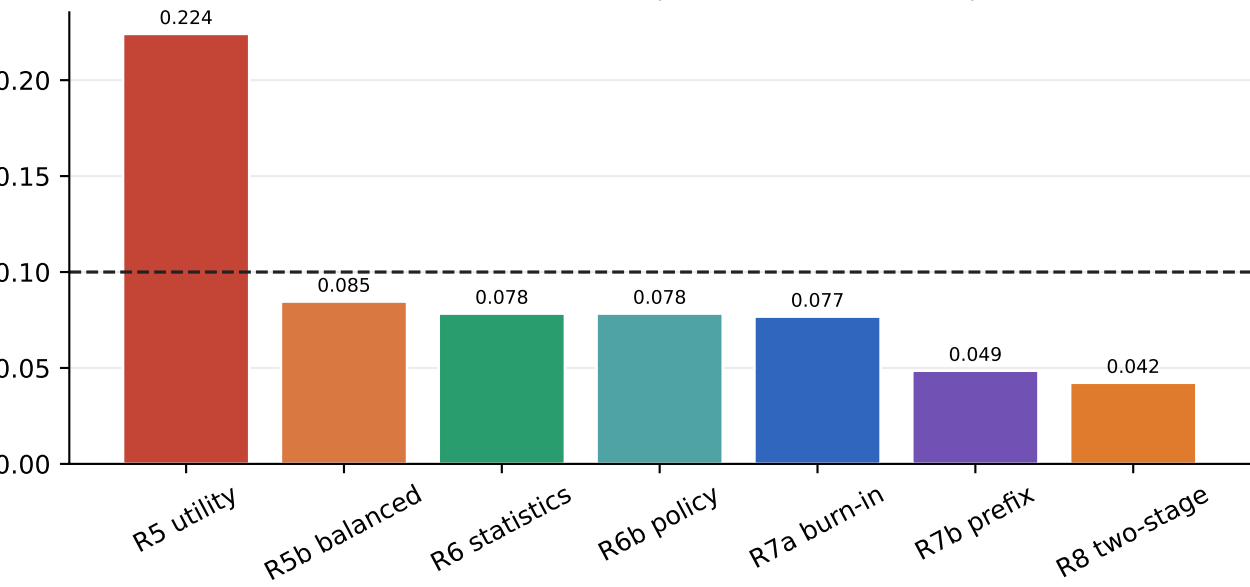

Mean utility (frozen minimum 2.5)

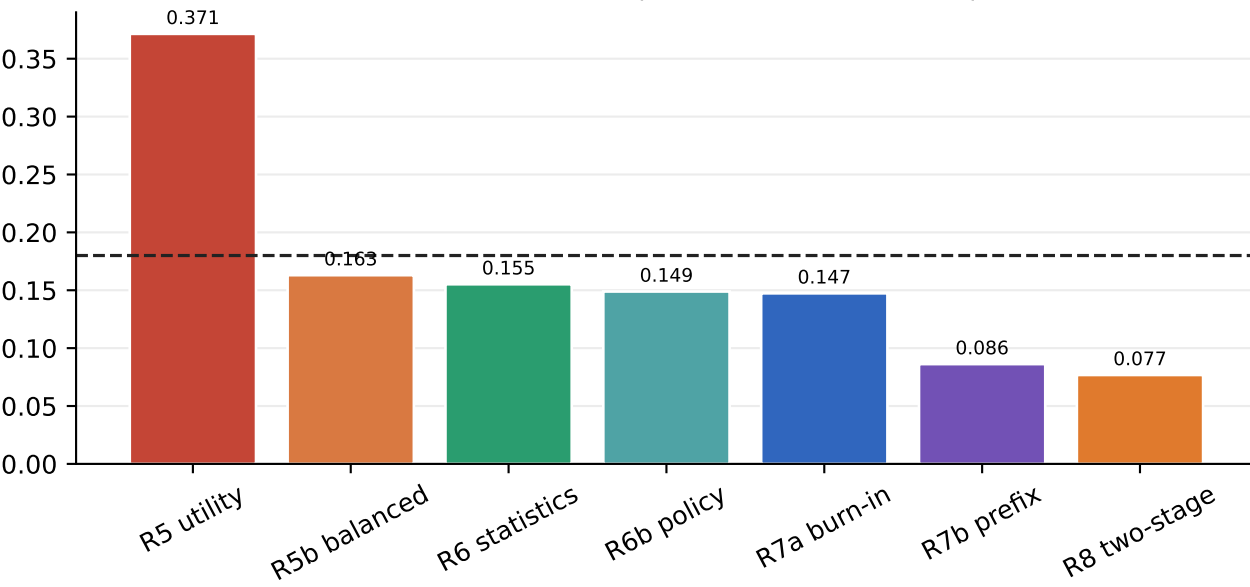

Mean PESQ improvement (frozen minimum 0.33)

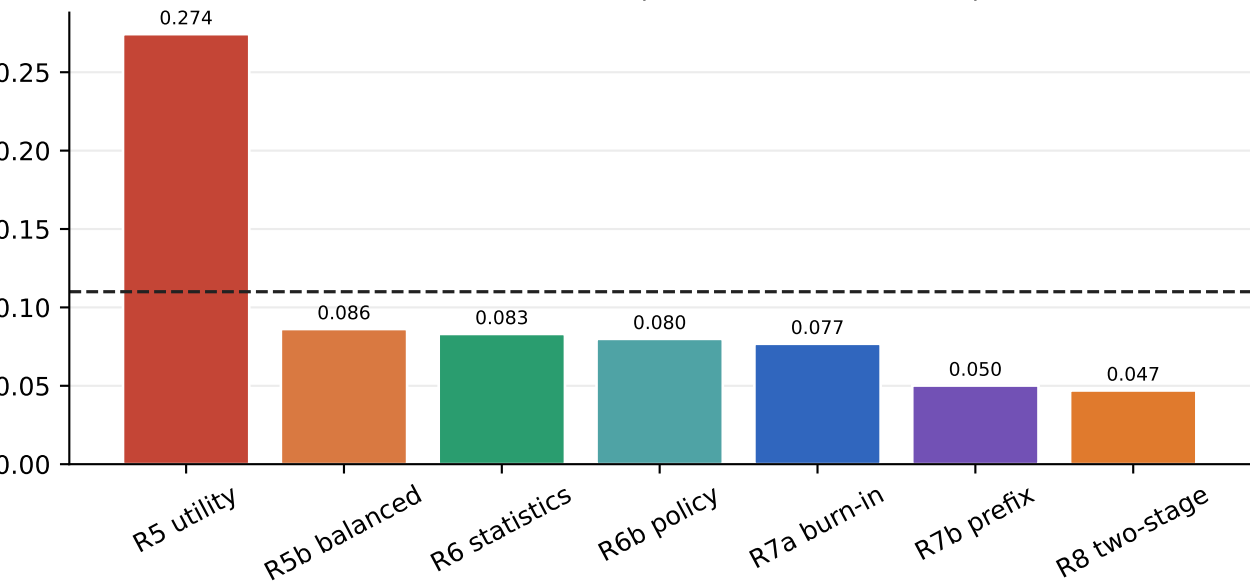

SI-SDR violation rate (frozen maximum 0.1)

STOI violation rate (frozen maximum 0.18)

ESTOI violation rate (frozen maximum 0.11)

Interpretation

- Lower is better for violation metrics.
- Higher is better for utility and PESQ improvement.
- No recipe crossed the frozen 0.20 avoidable-violation gate.
- R7a was the best balanced controller; R8 was not promoted.
